1 Motivation

For our project we were thinking about an API that could help us decide which shows to watch next, by marking shows as viewed and/or liked.

Because we can watch more than just movies, like anime, we wanted to use more than one dataset. Both animes and movies can have a lot in common not only with each other but also with books, so we also decided to use a book dataset.

So we have three datasets, and we can effortlessly search through any of them, mark them as seen or liked, and get suggestions. Having very similar categories in every single one of them.

For the suggestions our idea was making a recommendation list having in mind the item's rating and user's likes and views, which would indicate to us which categories the user prefers.

So it makes sense to call our API "Seen".

2 Dataset characterization

2.1 Dataset 1 — IMDB

This data set provides a lot of information about movies and shows that can be seen in IMDB.

We downloaded the dataset from the Kaggle website, updated one year ago.

From the whole data this were the columns that were important to us:

Columns	Example
id	606e2683b3fff1da8a207ae9
name	The Arrival of a Train
category	[Action,Documentary,Short]
rating	7.4
type	short

Table 1: Movie example in our database

2.2 Dataset 2 — MyAnimeList

For the second data set we got it from Kaggle, about the MyAnimeList website.

This data not only has a lot of anime content but also user information, but because we want to connect with the other datasets doesn't make sense to use that data. Meaning we used these columns:

Columns	Example
id	606e252aebddc73ebfb15507
name	Shakugan no Shana: Season II
category	[Action,Drama,Fantasy,Romance,School,Supernatural]
rating	7.72
imageUrl	https://myanimelist.cdn-dena.com/images/anime/10/18669.jpg

Table 2: Anime example in our database

2.3 Dataset 3 — GoodReads

At last, this data set represents books from the GoodReads website, also downloaded from Kaggle.

The helpful data from this data set, to be able to use with animes and movies, is its categories and rating:

Columns	Example
id	606e25ad5e927a606f534284
name	Of Mice and Men
description	The compelling story of two outsiders [...]
category	[Classics,Fiction,Academic,School,Literature,Historical]
rating	7.7
imageUrl	https://images.gr-assets.com/books/1511302904l/890.jpg

Table 3: Book example in our database

3 Use cases

We have 3 types of Users: an Admin, which is a logged-in user with special permissions, a Regular user, which is a logged-in user, and a not logged-in user that we call Any.

Services	User	Functionalities
Normal	Any	Sign in See Book, Show and Movie Library
	Regular	User Log in Set Book/Show/Movie as seen Set Book/Show/Movie as liked Ask for suggestions to read and/or watch Count how many views a specific Item has Count how many likes a specific Item has Top 10 Items with more likes
	Admin	Add Book/Show/Movie to Library Remove Book/Show/Movie from Library
Spark	Any	See best Director and his movies with cast See which Actor has the most connections

4 API

User	Path	get	post	put	del	description
Regular	/lib	×				Returns a <i>page</i> from the database
	/suggest		×			List of suggestions to watch
Admin	/item		×			Creates an item to add to the database
Any	/item /{type} /{id}	×			×	Gets/Deletes item with specific <i>id</i> and <i>type</i>
Regular	/item /{type} /{id} /seen			×		Marks item as seen
	/item /{type} /{id} /like			×		Marks item as liked
Any	/item /{type} /{id} /views	×				Returns Item's number of views
	/item /{type} /{id} /likes	×				Returns Item's number of likes
	/getTopTen /{type}	×				Returns top ten most liked Items with <i>type</i>
	/user		×			Creates User
Regular	/user /login	×				Logs in
	/user /logout	×				Logs out
	/user /search /{username}	×			×	Searches/Deletes User by username
Any	/director	×				Returns list with the best Director's movies and his cast
	/actor	×				Returns the Actor's name with movies with the biggest cast in total

5 Architecture (application and technical)

5.1 Diagram

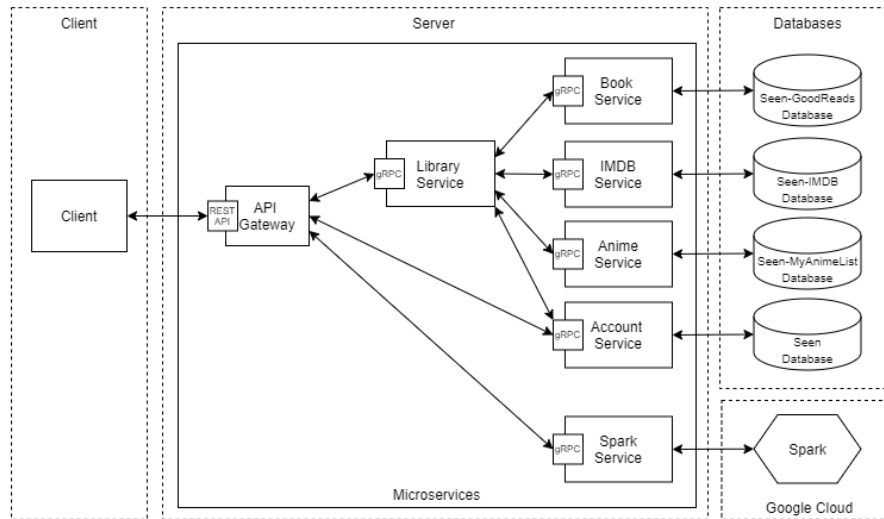

Figure 1: Project's architecture.

5.2 Application

5.2.1 Client

The Client should be able to access our API on his browser:

`https://recommendations.sytes.net`

The Swagger provides a user interface to use and test our calls by adding `/ui` to the end of the url above.

5.2.2 Server

In total there are 7 different microservices working at the same time. Every single one runs on the Google Cloud, inside the same cluster but different dockers.

5.2.3 Databases

Every database has a service that has the responsibility to access and manage it. While 3 of them are hosted by MongoDB a NoSQL database, the last one is an SQL database hosted by Google Cloud.

5.2.4 Google Cloud

6 Implementation

7 Evaluation and validation

8 Cost analysis

9 Discussion

9.1 Results

9.2 Analysis

10 Conclusions

10.1 Contributions

10.2 Future alterations
